*Go a little wild!*

The Capybara is the largest rodent species,  
and they are considered semi-aquatic

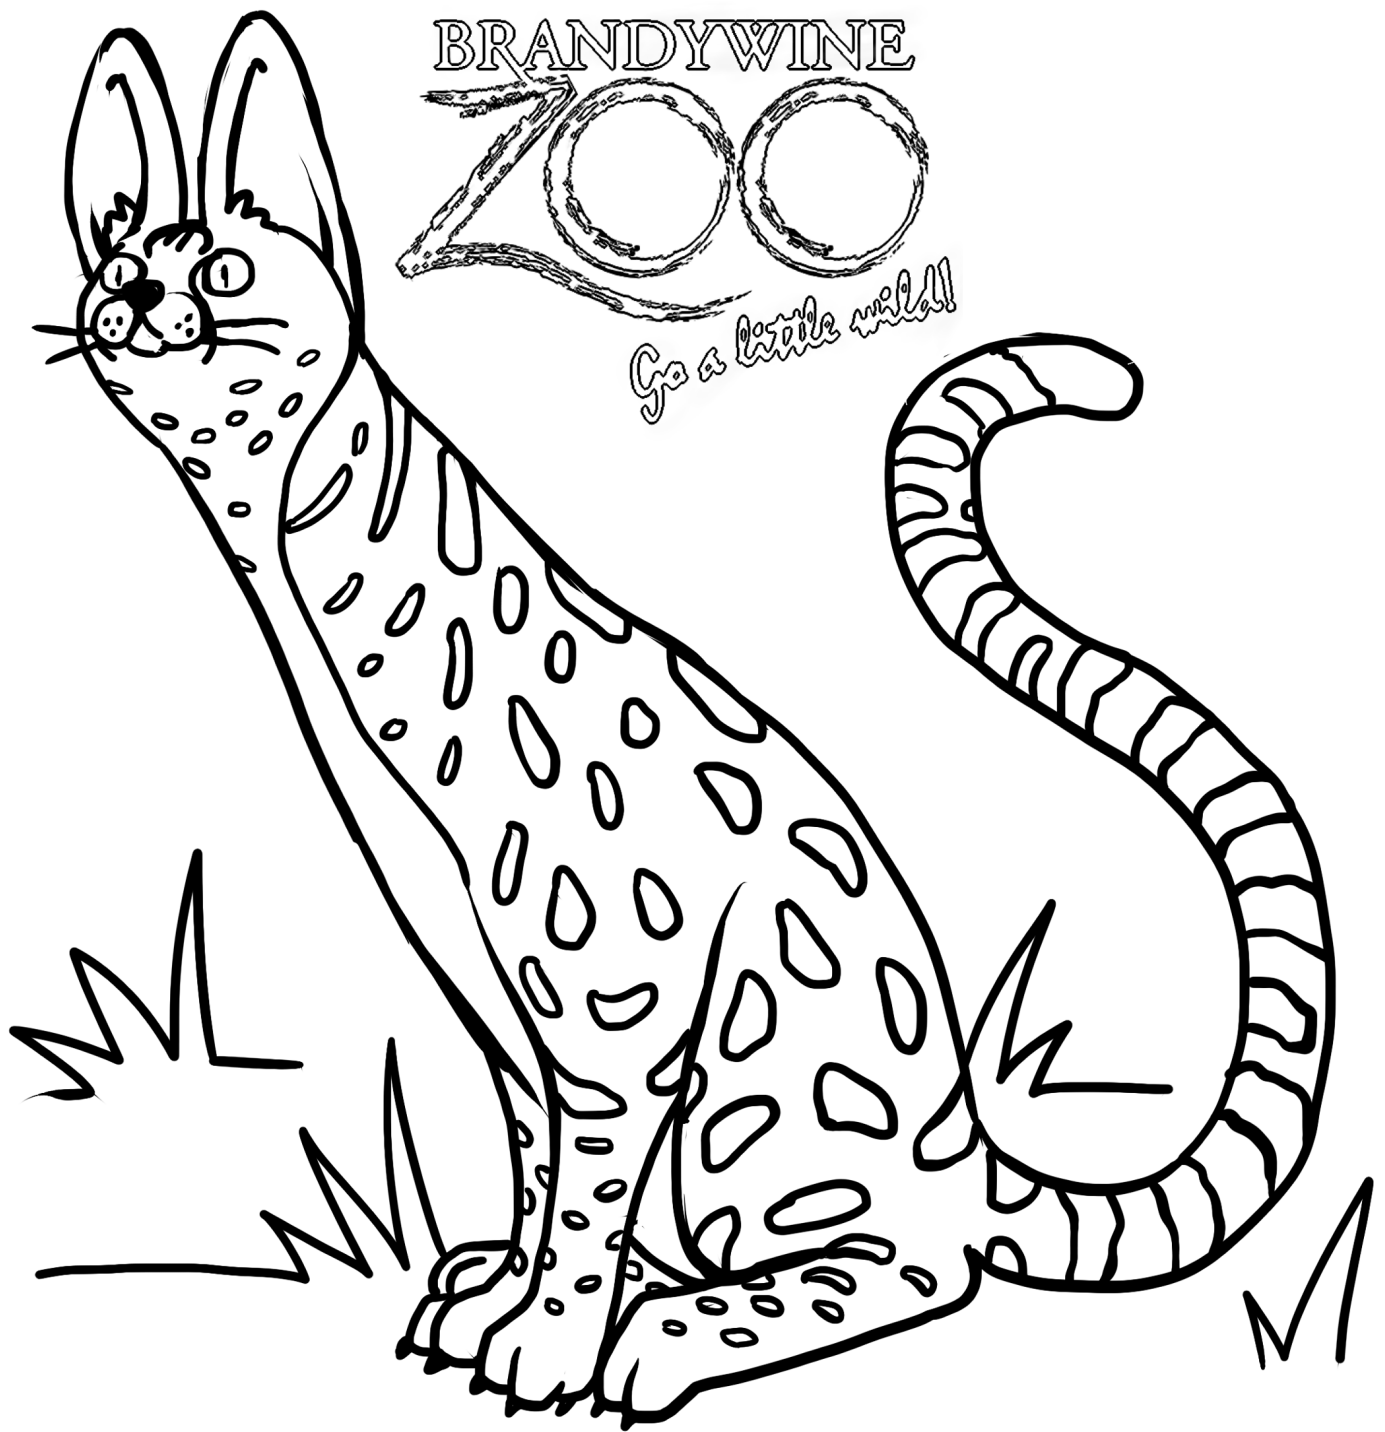

The North American Porcupine cannot shoot its quills, and if it were to fall from a tree and puncture itself it has antibiotics in its skin that help against infection

Red Pandas are not related to the Giant Panda. The word "panda" is derived from a Nepalese term "ponva" Which means bamboo eater

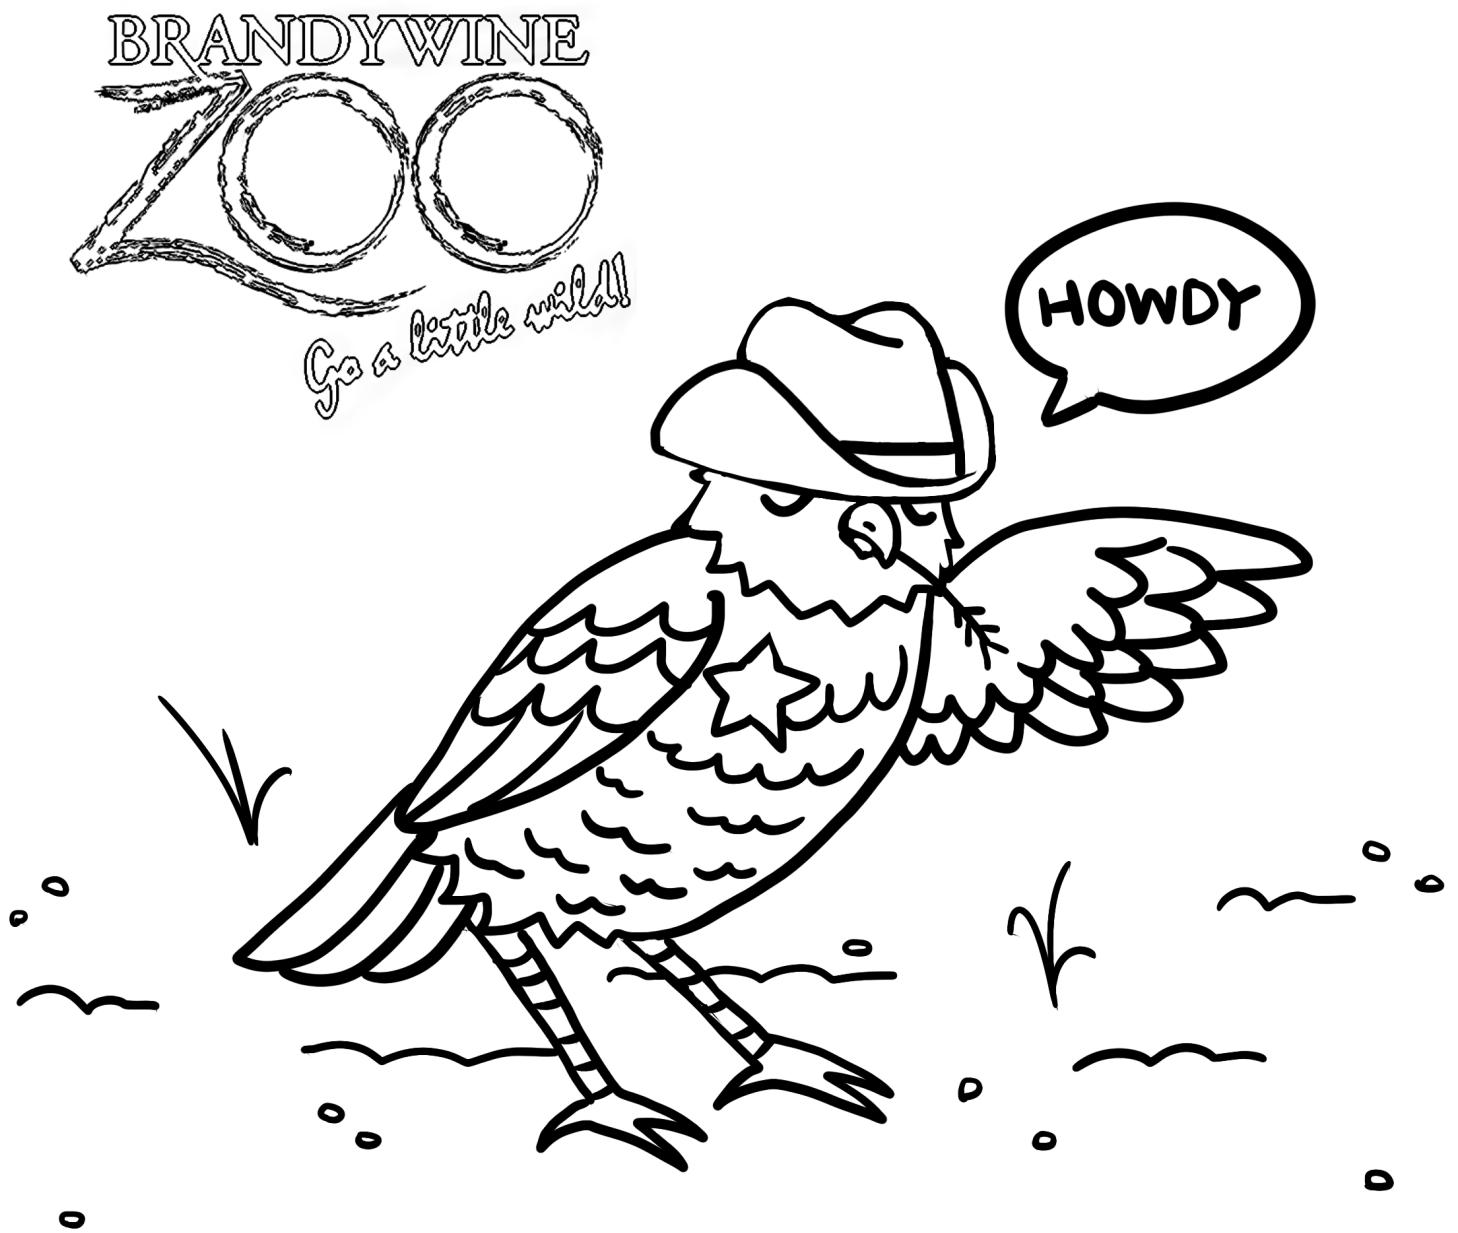

Their extra-long neck and legs gives Servals the nickname "giraffe cat." The large dish-like ears of the serval allow them to sense the vibrations of rodents that can be underground

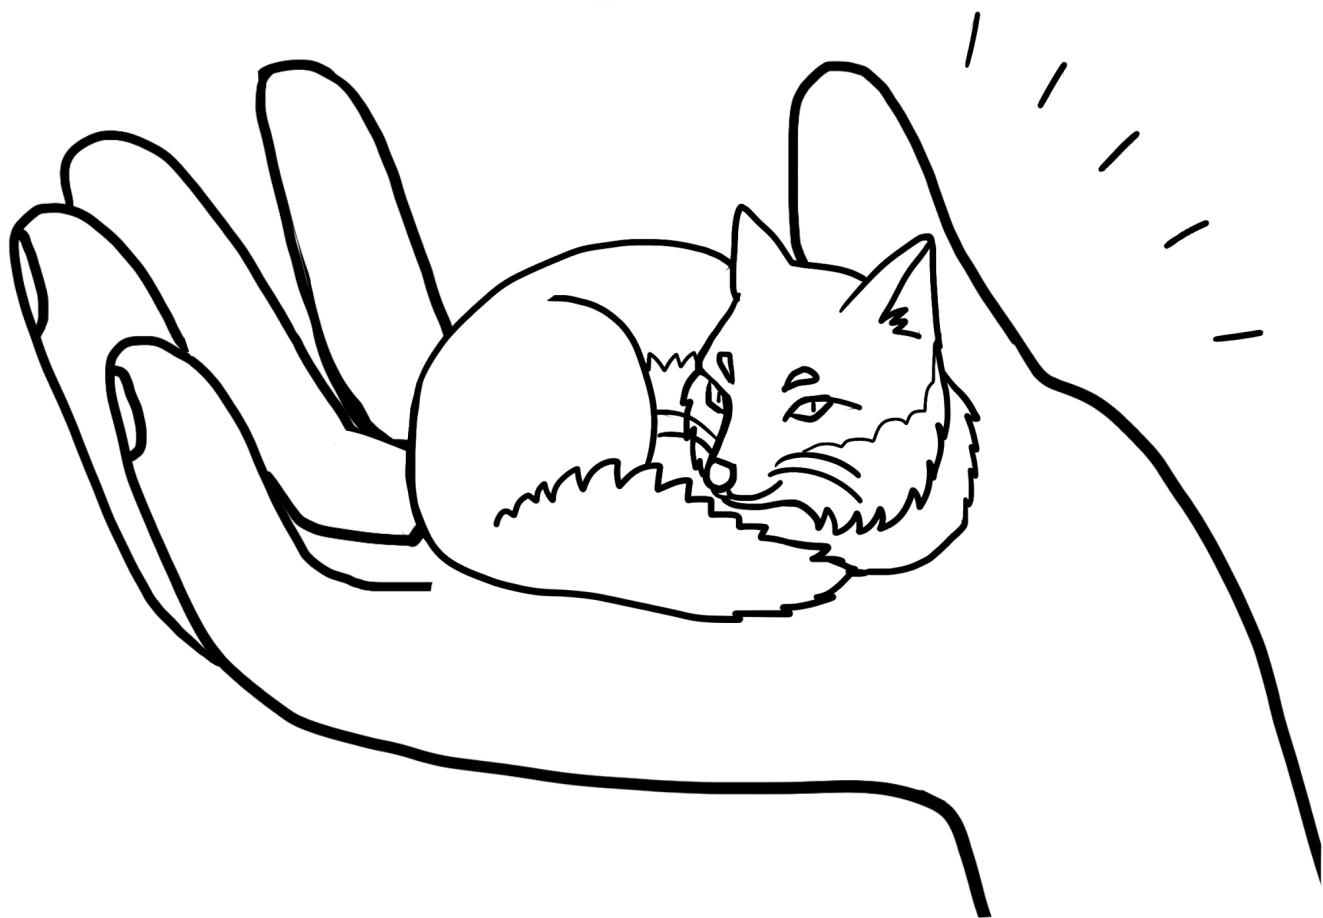

The toucan's beak appears quite heavy, but is actually light. It is hollow, made of keratin with thin rods of bone to support it - similar in consistency to a hard sponge

Cowboys sometimes called these burrowing owls "howdy birds," because they seemed to nod in greeting from the entrances to their burrows in prairie-dog towns.

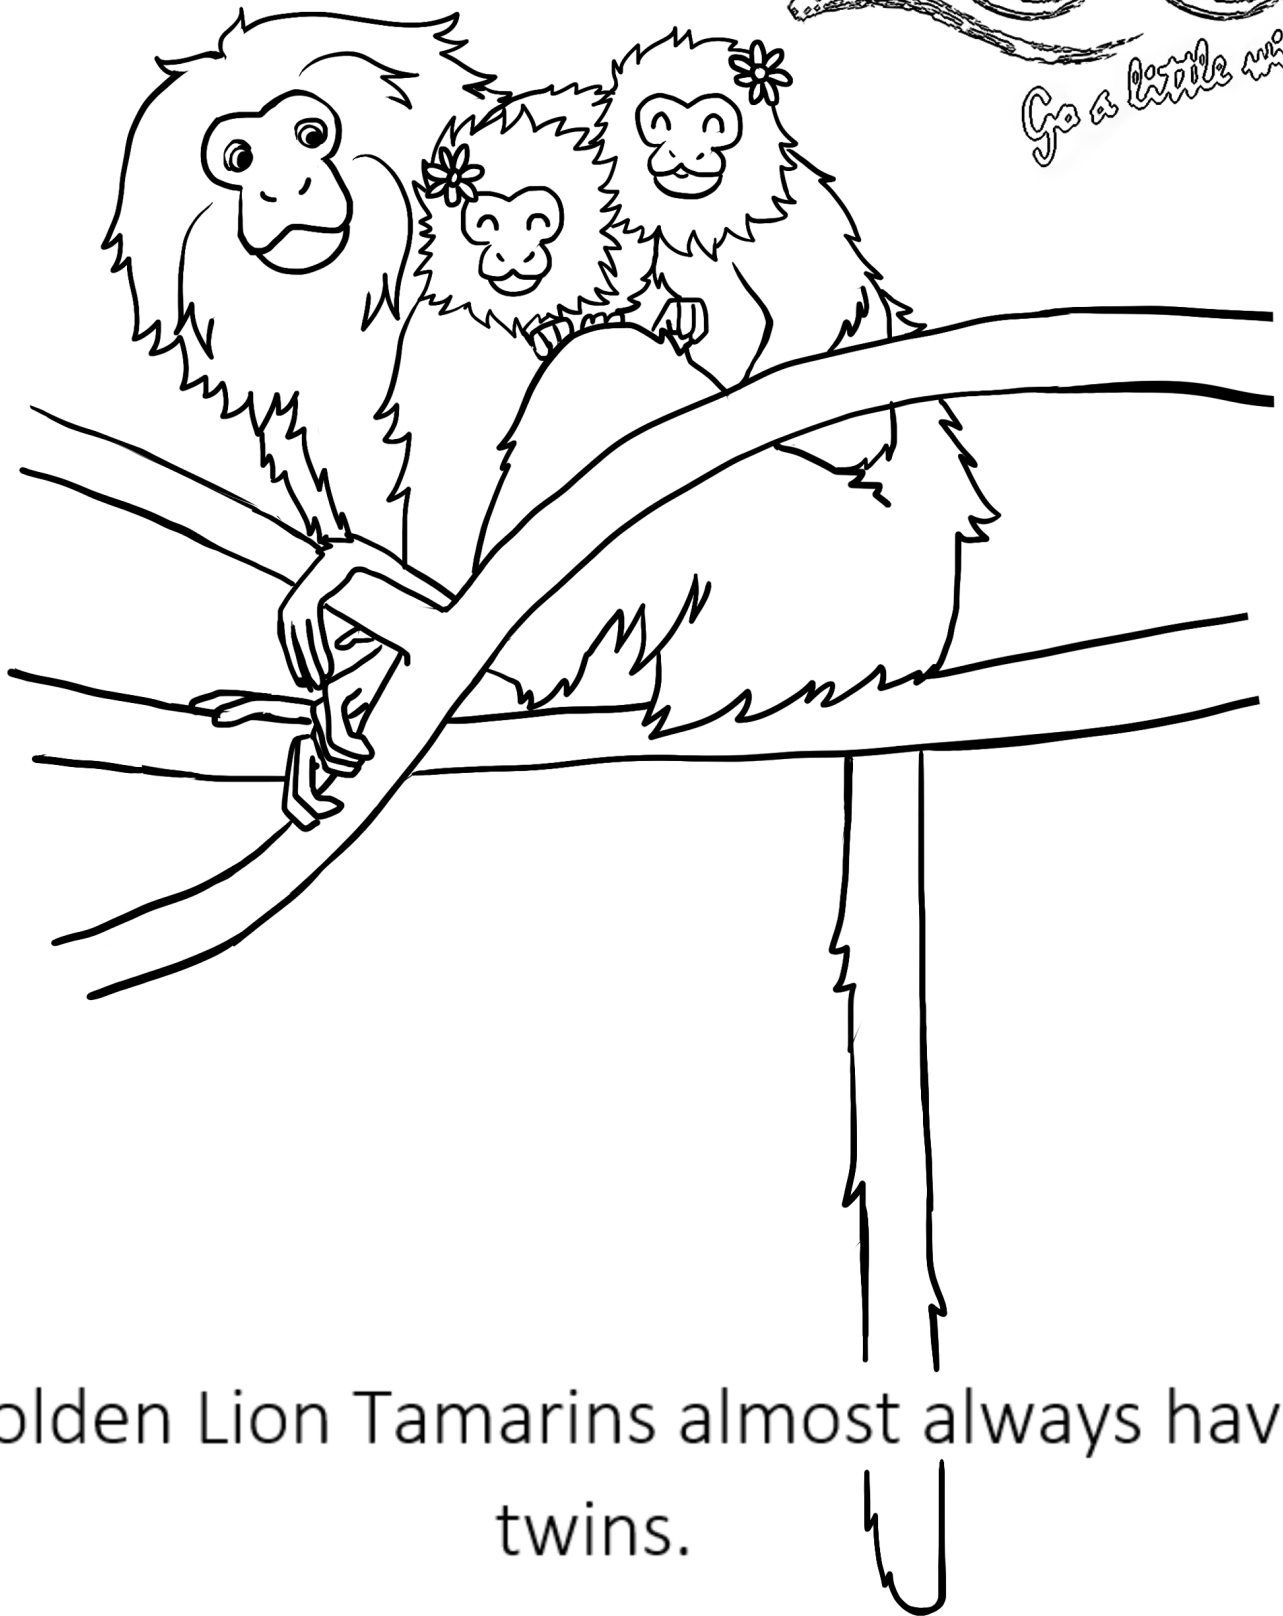

The Swift Fox is the smallest member of the dog family, and they have vertical pupils.
